

Please substitute the current paragraph 2 on page 8 with the following paragraph:

Figure 2 depicts the sequencing strategy for the *Pseudomonas 7A* glutaminase gene. Figure 2A: Map of the *P7A* glutaminase showing selected restriction sites, the shaded area depicts the region encoding the actual gene product. Hatch marks represent 100 bp. Arrows below this figure show the approximate positions and orientations of sequencing primers with their accompanying names. The arrows with stops indicate the extent and direction of individual sequencing experiments. Figure 2B: Names, sequences, and coordinates of sequencing primers (SEQ ID NOS: 3-11, respectively in order of appearance) are shown. Numbering is from the AAG encoding the N-terminal lysine residue.

Please substitute the current paragraph 2 on page 11 with the following paragraph:

The *P7A* glutaminase sequence (SEQ ID NO: 1) which is disclosed here can be used to identify similar sequences encoding similar proteins. (See Watson, J.D. *et al.*, in "Molecular Biology of the Gene." Benjamin/Cummings Publishing Company Inc., Menlo Park CA, Vol. I, p. 608 (1987)). For example, Southern hybridization experiments can be carried out in which prokaryotic or eukaryotic organismal DNA is probed with all or part of the glutaminase gene of the present invention. Typically probes contain at least about 15 bases of the glutaminase sequence in order to ensure that other non-related sequences do not hybridize. Sufficiently high temperature and low salt concentrations further reduce hybridization to non-related sequences. Using such techniques, homologous genes have been found to *dnaA* of *E. coli* in *Pseudomonas putida* (Ingmer and Atlung, Mol. Gen. Genet. 232, 431 (1992)) and to *ras* in a variety of eukaryotic organisms (Matsui, Gene

76:313 (1989) and Hori, Gene 105:91 (1991)). There is a high probability that DNA sequences that hybridize to the *P7A* glutaminase DNA represent genes encoding enzymes of similar function. Genes which are isolated by this technique can be expressed, and the enzymes can be tested to determine if they share the desirable characteristics identified for the *P7A* glutaminase.

Please substitute the current paragraph 1 on page 21 with the following paragraph:

This example demonstrates the identification of a clone containing the sequence coding for *Pseudomonas 7A* glutaminase and determination of its nucleotide sequence (SEQ ID NO: 1).

Please substitute the current paragraph 1 on page 23 with the following paragraph:

Table 1. OLIGONUCLEOTIDE PROBES USED FOR DETECTING THE GLUTAMINASE GENE

Peptide Sequence (1-5)	(portion of SEQ ID NO: 2) NH <sub>2</sub> -Lys-Glu-Val-Glu-Asn
Probe A (14-mer x 32)	(SEQ ID NO: 12) AA (AG) GA (AG) GT (TCAG) GA (AG) AA
Peptide Sequence (161-166)	(portion of SEQ ID NO: 2) Met-Asn-Asp-Glu-Ile-Glu
Probe B (18-mer x 48)	(SEQ ID NO: 13) ATGGA (TC) GA (TC) GA (AG) AT (TCA) GA (AG)
Peptide Sequence (332-36)	(portion of SEQ ID NO: 2) Ile-Phe-Trp-Glu-Tyr-COOH
Probe C (14-mer x 12)	(SEQ ID NO: 14) AT (TCA) TT (TC) TGGGA (AG) TA

In order to confirm the identity of the putative PGA clone, the region of homology to the probes used for screening was localized by Southern blot analysis, and the appropriate fragments were partially sequenced. This analysis identified a 1.1 Kb Sail

fragment which hybridized to probe A, and a 1.5 Kb SalI fragment which hybridized to probe B. This indicated that there was a SalI site within the gene, and that sequencing from this site would immediately confirm the identity of the gene as PGA by comparing the nucleotide sequence with the known amino acid sequence. Sequencing of the 1.1 kb SalI fragment showed that this fragment encodes the N-terminal 42 amino acids of the glutaminase.

Please substitute the current page 26 with the following:
